TAKE-HOME PROJECT DOCUMENTATION

Fulfillment Hub

Use of AI Note

AI TOOLS USED

ChatGPT (OpenAI) — Used as a development assistant and brainstorming partner

HOW I HAVE USED AI

During the development process, I utilized AI as an assistance tool for development and brainstorming rather than a substitute for my own decision-making. Specifically, I used it for:

- Initial structuring of the HTML, CSS, and JavaScript implementation.
- Debugging JavaScript and UI issues encountered during development.
- Exploring various methods to visually represent the fulfillment workflow.
- Improving the usability and layout of the Office Dashboard and Warehouse Floor interface.
- Evaluating the prototype to identify missed workflow aspects and correcting operational edge cases.
- Refining the project walkthrough and articulating the rationale behind product decisions.

Note: *All sample orders, inventory data, exceptions, and fulfillment scenarios were specifically developed independently for this prototype.*

DIVERGENCE & DISAGREEMENTS WITH AI SUGGESTIONS

01 Staying Focused on Product Scope

The AI suggested multiple advanced features to expand comprehensiveness, including extensive warehouse management and automation. I rejected these additions because the brief defined a smaller operation with a simplified existing workflow. I maintained focus on resolving core operational pain points—order visibility, priority handling, stock issues, stalled orders, picking verification, and pickup visibility—rather than building an over-engineered WMS.

02 Making Stock Transfers Operationally Realistic

An initial AI suggestion enabled instant stock transfers from the secondary to the main warehouse via a single click. Recognizing that physical stock transfers require time and multi-step handling, I adjusted the logic to a three-step workflow: *Requested* → *In Transit* → *Received*. This requires explicit user actions and models real-world physical transit times.

03 Aligning Inventory Updates with Real-World Operations

The initial model updated inventory only when transfers completed, failing to reflect stock reductions during order pick-and-pack steps. I requested changes to decrease main-warehouse stock immediately upon order picking, ensuring the inventory metric accurately reflects real-time available stock.

MY OVERALL APPROACH TO AI

I treated AI outputs as possibilities to evaluate rather than prescriptive solutions. Each suggestion was assessed strictly against the requirements of the brief. Where suggested features introduced unnecessary complexity without adding operational value, or misrepresented realistic workflow dynamics, I overrode the model. Final feature scope, workflow design, scenario logic, and product priorities were directed entirely by my own operational analysis.
